**Abstract:** Automatic car: That the clutch is left out is not progress.

**Key Words:** car, automatic gear, accelerator, brake, clutch,

自动挡汽车减掉离合器，不是进步。其理由是：第一，驾驶员左脚闲了起来，在驾驶操作上出现了不对称，长此以往，心理上和精神上都会出现失衡的现象。第二，作者曾在另文中说到，有离合器的车，踩刹车时，一般的作法是同时踩下离合器。由于切断了发动机传来的扭矩，即便错踩（踩刹车而错踩油门），车也不会加速。而且，发动机空转的吼叫声将提醒你“踩错了！”。自动挡车减掉了离合器，没有发动机空转的吼声。错踩之初，可能还以为没踩住，继续用力，车子自动加档提速。后果不堪设想。第三，有人提议，将油门或者刹车移至左脚。而这很不可取。因为，遇突发事况，精神紧张，驾驶员会双脚同时踩下。

That automatic car left out the clutch is not progress. The first reason is that the driver's left foot is idle. So the no symmetry on operation appeared and if things go on like this, there will be the imbalances in driver's mental and spiritual. The second is that the author once said in another paper that if the car has a clutch, when the driver step on brakes the general practice is the clutch is disengaged at the same time. Due to the torque from engine being cut off, so even if *wrong step* (to step on brakes, but as a result step on the accelerator), the car will not accelerate. And the roar of engine idling will remind you "wrong step!". Automatic cars have saved clutch, have not the roar of engine idling, so at the beginning of the wrong step the driver might have thought without stepping in place. Continues to step on, the car will automatically accelerate. the consequence is disastrous. The third is that there is a proposal that the accelerator or the brakes is moved to the left. But this is not desirable, because in case of unexpected things driver's both feet will step together on with nervousness.
